

How to Improve the Competitive Performance of Your Contest Station

Contest success often depends on how well
you prepared your station for competition

Necessary First Steps in Identifying Candidate Station Improvements

- Identify realistic time phased personal contest goals for selected contests, entry categories and competition region
 - first place winner, or
 - consistently placing in the top three, or
 - consistently placing in the top ten, or
 - successfully competing with your selected peers
- Identify the realistic constraints that limit your station improvements
 - desired time frame for achieving your contest goals
 - amount of your available time to implement station improvements
 - available physical space for more antennas and station equipment
 - annual funds available to support your station improvements
- Achieve a balance between your goals and constraints

Well Before the Contest Evaluate Your Station's Strengths and Weaknesses Compared to Your Peer Competitors

- Identify your station's strengths and weaknesses -- including reliability -- relative to your peer competitors
 - transmitting and receiving antennas, feedlines and antenna switching
 - transceiver performance – focusing on receiver performance
 - amplifier output power and reliability
 - audio and CW keying quality
 - computers, software and their internal and external networks
 - all aspects of your station environment that limit operator performance
 - external and inter-station RFI problems
- Identify opportunities to improve your station's weaknesses and reliability relative to your peer competitors
 - in every category above
 - prioritize your total list of improvement opportunities

During and After Every Contest Prepare Notes Documenting Your Station's Strengths and Weaknesses Compared to Your Peer Competitors

- Identify every aspect of your station's performance that was strongly competitive compared to your peer competitors
- Identify every aspect your station's performance that was not competitive compared to your peer competitors
- Identify improvements that your peer competitors can't match
- Identify every opportunity for station improvement that could have improved your score in this contest, in priority order by:
 - estimated score improvement resulting from each improvement
 - degree of difficulty in achieving each improvement
 - practicality of achieving each improvement
 - impediments to achieving each improvement
 - expense to achieve each improvement

Tower Inspections and Maintenance Will Help You Avoid Mid-Winter Failures and Reliability Problems During Your Next Contest

- Measure all guy wire tensions (7 to 15% of breaking strength)
- Inspect guy wires, guy hardware and guy anchors for damage
- Inspect tower plumb and twist
- Inspect the tower base for standing water and
 - corrosion, settling and cracks at the tower-to-concrete interface
 - regularly remove all debris from tower bases to avoid corrosion
- Inspect rotator performance and play
- Inspect the tower for wind damage
- Pay special attention to damaged, loose, missing or corroded:
 - diagonal and horizontal trusses, welds and hardware
 - especially adjacent to guy attachments

Antenna Inspections and Maintenance Will Help You Avoid Mid-Winter Failures and Reliability Problems During Your Next Contest

- Inspect coax cable for cuts, cracks, damage and moisture intrusion
 - cuts, chaffing and wear rotator loops
 - Water intrusion at electrical and physical attachments to antennas
- Compare coaxial cable losses to prior measurements
- Compare antenna VSWRs to prior measurements
- Inspect connector water proofing and PL-259 tightness
- Inspect for rope wear - replace rope before it fails
- Inspect antenna wire for wear and connections to feed lines
- Repair or replace unreliable, failing or overloaded rotators
- Inspect antennas and coaxial cables for lightning damage
- Inspect antennas, feed lines and rotators for wind damage

Improving the Competitive Performance of Coaxial Cables for Multi-tower Stations

- Coax longer than 300 feet is often used in multi-tower stations
- Andrew Heliax is an ideal choice for lengths up to:
 - 10 meters: 600 feet of LDF5-50A 7/8 inch Heliax, or 300 feet of LDF4-50A 1/2 inch Heliax
 - 15 meters: 700 feet of LDF5-50A 7/8 inch Heliax, or 350 feet of LDF4-50A 1/2 inch Heliax
 - 20 meters: 900 feet of LDF5-50A 7/8 inch Heliax, or 450 feet of LDF4-50A 1/2 inch Heliax
 - 40 meters: 1200 feet of LDF5-50A 7/8 inch Heliax, or 600 feet of LDF4-50A 1/2 inch Heliax
- Be cautious of the windload and weight (including ice load) of large Heliax cables mounted on light duty towers

Improving the Reliability of Coaxial Cable Connectors

- N and UHF connectors are the most common choices
- No significant loss in either N and UHF connectors at HF
- No significant difference in the VSWR of N and UHF connectors at HF
- High quality silver plated UHF connectors provide much more center pin mating force than N connectors
 - eliminates cross-station interference and connector failures from potentially unreliable N connector center pin mating force
 - **avoid saving a few dollars on cheap unbranded hamfest connectors**
- Avoid use of adapters, but if necessary be sure they are name-brand silver plated adapters, not nickel plated
- Always use a wrench to tighten UHF connectors 1/4 turn
- Inspect SO-239 connectors for center pin mating pressure

Coaxial Cable

Amphenol 83-1SP PL-259 Connector

Shell labeled exactly:
Amphenol 83-1SP
with no additional digits!

DX Engineering, Mouser Electronics and RF Connection

Coaxial Cable Connector Waterproofing

Cover the connectors with two 50% overlapped layers of Scotch 130C stretched to 50% of its original width, sticky side facing out

Cover the Scotch 130C with two 50% overlapped layers of Scotch 33+ or Scotch 88

Indoor Station Performance and Reliability Improvements

- Transceiver performance (sensitivity, dynamic range, filters)
- Amplifier output power and reliability
- Digital Wattmeters
- Physical environment that degrades operator performance
 - noise, chair, ventilation, desk height, equipment placement, line of sight
- Keyers and paddles
- Microphones
- Computer keyboards
- Computer monitors
- Computers
- Antenna switching
- DX spotting network displays and alarms
- Propagation map displays from the Reverse Beacon Network
- Connector reliability, PL-259s tightly connected, SO-239 wear

Execute Your Proof of Performance Checklist Before Every Contest

- Prove that everything in your station is in working properly
 - well before the contest
 - improve and update your checklist regularly
 - record all performance measurements
- Never enter a competition with unproven equipment
- Prove that all indoor and outdoor equipment is working far enough in advance so you can make necessary repairs

Single Operator (non SO2R) Station Improvement Ideas

- Antenna improvements are almost always more effective and less expensive than any other station improvement and they improve both transmitting and receiving performance
- Receiving antennas make a big improvement on 160 and 80 meters
- Identify and mitigate RFI sources well before the contest
- Many modern transceivers have much improved receiver dynamic range and filter selectivity
 - know how to adjust your receiver for optimum dynamic range on every band
 - Check your receiver's sensitivity every time you sit in front of it
- A wattmeter allows you to monitor transmitter and antenna performance during the contest

Single Tower Antenna Improvement Ideas

- 50-60 foot tower and a small rotator (e.g., HyGain Ham-IV)
 - small tribander, Hex-beam or quad
 - 40 and 80 meter dipoles and a 160 meter inverted-L
- 70-80 foot tower and a medium rotator (e.g. HyGain T2X)
 - Cushcraft XM-240 two element 40 meter Yagi
 - large tribander such as the SteppIR 4 element Yagi
 - 80 meter dipole and a 160 meter inverted-L
- 100-140 foot tower and a large rotator (e.g., M2 Orion)
 - Cushcraft XM-240 two element 40 meter Yagi
 - monoband Yagis such as the HyGain LJ series on ring rotators
 - 80 meter dipole and a 160 meter inverted-L

SO2R Station Improvement Ideas in Addition to Single Op Improvements

- Receiving bandpass filters are almost always necessary to protect transceivers from cross-band interference and physical damage
- Low power bandpass filters may be needed on transceiver outputs if your transceiver radiates broadband phase noise (many do)
- Stubs may be necessary on amplifier outputs if antennas are in close proximity
- Multiband antennas can cause excessive cross-band interference
- Most operators find it more effective to use multiple computers and keyboards
- Identify and resolve all cross-band interference
 - intermodulation caused by transmitted signals entering unprotected consumer electronic devices often re-radiate strong harmonics mixed with AC power or computer network signals creating broadband noise modulated sidebands on the transmitter harmonic
